

ALIE JANNEH

Co-Founder, ARGUS · Cloud & DevOps Engineer · SRE

São Paulo, Brazil
cjanneh@gmail.com
linkedin.com/in/alie-janneh · github.com/janneh2000

SUMMARY

Co-founder of **ARGUS**, a security and intelligence platform for the Web3 / Solana ecosystem — shipping four products in parallel (Protocol Guardian, SolGuard, Mosaic, and an AI Venture Studio) with co-founder Antonio. **8+ years** architecting multi-cloud infrastructure across **GCP, AWS, and OCI**, with deep production experience at Banco BV and Foxconn. Google Cloud Professional Cloud Architect, bilingual (PT/EN), based in São Paulo — ready to bring founder-level ownership and SRE rigor to Google Cloud's customer engineering and reliability teams in Brazil.

TECHNICAL SKILLS

Cloud Platforms	Google Cloud (GKE, Cloud Run, Cloud Functions, BigQuery, Composer, Cloud Build, Cloud Monitoring), AWS, Oracle Cloud Infrastructure
Infrastructure as Code	Terraform, Helm, Ansible, Pulumi, CloudFormation
Containers / Orchestration	Kubernetes, GKE, Docker, Docker Compose, ArgoCD, Istio
Observability / SRE	Prometheus, Grafana, Loki, Alertmanager, Cloud Monitoring, SLO/SLI design, incident response
CI/CD	GitHub Actions, GitLab CI, Cloud Build, Jenkins, ArgoCD, Cosign image signing
Languages	Python, TypeScript, Rust, Bash, SQL, JavaScript
Web3 / AI	Solana, Anchor, SPL Tokens, Helius RPC, on-chain intelligence, LLM agent pipelines
Languages (spoken)	Portuguese (native), English (fluent)

EXPERIENCE

Co-Founder · Engineering & Infrastructure · ARGUS

2025 — Present · São Paulo, Brazil

- Co-founded ARGUS with Antonio — a security and intelligence platform for the Web3 / Solana ecosystem; lead engineering across infrastructure, product, and developer experience.
- Shipped **Protocol Guardian**, ARGUS's real-time DeFi defense layer: exploit signatures, economic-anomaly detection, and protocol-side response automation for on-chain teams.
- Shipped **SolGuard**, a Solana-native security toolkit covering smart-contract scanning, validator hygiene, and runtime guardrails — positioned as a default safety primitive for Solana builders.
- Shipped **Mosaic**, ARGUS's on-chain intelligence aggregator composing multi-protocol signals into a single queryable data surface for analysts, traders, and risk teams.
- Built the **ARGUS AI Venture Studio**, an internal LLM-driven tooling layer that lets a two-founder team prototype, validate, and ship adjacent product bets in parallel — the engine behind ARGUS's product velocity.
- Own the company's cloud footprint end-to-end: Terraform-managed GCP landing zone, GKE workloads, CI/CD pipelines, and Prometheus/Grafana/Loki observability across services.

Cloud Engineer — Google Cloud · Banco BV

2022 — 2024 · São Paulo, Brazil

- Engineered Python-based automation workflows and Google Cloud infrastructure for one of Brazil's largest financial institutions, operating inside strict regulated-banking compliance and audit requirements.
- Owned BigQuery data pipelines and Composer-orchestrated workflows feeding analytics and reconciliation systems, including schema management, partitioning, and cost-optimised query design.
- Provisioned and maintained GCP resources via Terraform — IAM, VPC, Cloud Functions, Cloud Run, and Cloud Storage — standardising landing-zone patterns across product teams.
- Partnered with security and platform teams to harden CI/CD pipelines, rotate service-account credentials, and instrument Cloud Monitoring alerts with SLO-aligned thresholds.

DevOps Engineer · Foxconn

2020 — 2022 · São Paulo, Brazil

- Managed Kubernetes-based container orchestration and Python automation for manufacturing-scale operations across multiple production sites.
- Built CI/CD pipelines and platform tooling that cut deployment friction for application teams while supporting high-throughput production lines with strict reliability targets.
- Instrumented monitoring and alerting for plant-floor services, contributing to platform stability during peak manufacturing throughput.

Systems / Infrastructure Engineer · Early Career

2018 — 2020 · Brazil

- Built foundational expertise in Linux administration, networking, virtualization, and on-prem-to-cloud migrations.
- Wrote Bash and Python automation that replaced manual operations work, and supported infrastructure operations across a portfolio of internal systems.

ARGUS PRODUCTS

- **Protocol Guardian** — Real-time security and defense layer for DeFi protocols. Detects exploit signatures, economic anomalies, and governance attacks; routes alerts and triggers protocol-side responses.
- **SolGuard** — Solana-native security toolkit — contract scanning, validator hygiene, and runtime protection. Designed as the default safety primitive for Solana builders.
- **Mosaic** — On-chain intelligence aggregator composing multi-protocol, multi-chain, and oracle signals into a single queryable surface — the data backbone of ARGUS.
- **AI Venture Studio** — Internal AI-augmented venture studio: LLM-driven ideation, prototyping, and GTM playbooks that compound the team's build velocity across ARGUS product bets.

OPEN SOURCE & SELECTED WORK

- **Solana Vault Standard (solanabr/solana-vault-standard)** — Three merged PRs (SVS-7, SVS-10, SVS-11) hardening SPL token program pinning and native mint validation across the official Brazilian Solana vault spec — work that fed into SolGuard.
- **Terraform GCP Landing Zone** — Modular Terraform reference for production GCP landing zones — folders, IAM, VPC-SC, log sinks, audit baselines — reused inside ARGUS for our GCP footprint.
- **DevOps Monitoring Stack** — Reference Prometheus + Grafana + Loki + Alertmanager observability stack, Docker Compose-driven, reused across ARGUS internal infrastructure.
